To assess the effect of roxithromycin treatment on the composition of whole saliva and on the secretory activity of the salivary glands, 20 children with recurrent aphthous stomatitis (RAS) (11 boys, 9 girls) were given roxithromycin (6 mg/kg body weight per day) for 30 days. The children were divided into two groups. In the first group, the children underwent bacteriological and histopathological examinations of the oral mucosa and measurement of whole saliva flow (WFS) and secretory activity (SA) on days 15, 21 and 30. In the second group, clinical examinations, WFS and SA measurements were carried out on day 15 and the children were also examined bacteriologically and histopathologically on day 30. A significant increase was observed in WFS and SA in the group receiving oral roxithromycin. There was a significant decrease in the number of bacterial colonies on the gingival and buccal mucosa of the children receiving oral roxithromycin.Modern computing systems can provide electronic messaging services to users. For example, a computing system may provide a user with access to electronic mail messages, text messages, and voicemail messages. As another example, a computing system may provide a user with access to a social networking service, such as a Twitter™ or a Facebook™, which enables the user to send messages to other users. Unfortunately, when a user is accessing their messaging service, the user may be interrupted with various types of interruptions. For example, a user may receive an interrupt from a remote caller who has a voice message to leave for the user, or the user may receive an interrupt from an external system, such as an email service, that wants to send the user information. In another example, a user may receive an interrupt from a text message that the user has received, or a phone call that the user has received. Unfortunately, if the user does not have access to their messaging service at the time they receive 82157476af
